According to the Oxford University Press, strategy is defined as “a plan of action designed to achieve a long-term or overall aim.” Why is strategy of importance to urologists? Many urologists end up in formal administrative leadership roles, yet most receive little or no formal education or training on strategy and how to develop and execute a strategic plan. In these leadership roles, urologists and other physicians are often required to aid in the development of strategic plans or at least action plans designed to achieve long-term goals. For example, urologists may become involved in the development of strategic plans for their regional urology program, their own department or division of urology/surgery, or may become involved in their hospital’s, university’s and/or school of medicine’s strategic planning process in some capacity. There are several additional examples of situations urologists may face that require an understanding of strategy and its implementation, including the building of a new clinic or clinical institute, the opening of a new surgical suite or a standalone surgical centre, the building of a new research centre, the opening of a new residency or fellowship program, or — of current interest to academic urologists — the initiation of a new educational program, such as the Royal College of Physicians and Surgeons of Canada’s Competence By Design (CBD) competency-based medical education (CBME) initiative. The objective of this article is to introduce urologists to the basic concepts of strategy and key components and steps in the strategic planning process so they are prepared when called upon to lead strategic initiatives or become involved in a strategic planning process.

Elements of a strategic plan

The early stages of the strategic planning process focus on formulation of the strategic plan, whereas the late stages focus on implementation in order to achieve the objectives of the strategic plan. Various outlines of the elements of strategic plans have been described, and one sample outline is presented in Table 1.

Overview of the strategic planning process

The strategic planning process starts with gathering input from key stakeholders through meetings, interviews, surveys, storyboarding exercises, or any combination thereof. The goal is to ensure that all relevant issues within the organization are captured so the strategic plan doesn’t miss the target. Based on the input, the strategic framework — the mission, vision, values, and strategic priorities — are defined and communicated. Communication to key stakeholders, particularly the people who keep the engines of the organization running day-to-day, is important throughout the process, but especially at key points. Strategic priorities arise from the strategic framework and lay the foundation for the implementation plan through action plans for each strategic priority’s objectives. The most responsible person and timelines generally accompany each action plan so each milestone can be tracked and followed through on to ensure success of the strategic plan. After implementation, formal review of the plans, objectives, and strategies is necessary to allow any necessary adjustments. Solid strategic plans incorporate ongoing fluid reviews mid-implementation to ensure quick adjustments where appropriate. An example of a typical strategic planning process is shown in Fig. 1.

Strategic framework: mission, vision, and values

Central to any organization’s strategic planning process is the development and communication of its strategic framework. This includes the organization’s mission statement, vision, value proposition, and core values. The mission speaks to the ongoing daily and weekly function and purpose of the organization, whereas the vision refers to a bigger picture evaluation of where the organization wants to go and what it strives to be. There is evidence in the strategy literature that a complete and high-quality mission state-
ment has a significantly positive effect on an organization’s financial performance.\textsuperscript{4} Mission and vision statements can vary in length. In its five-year 2014–2019 strategic plan, the Canadian Urological Association’s (CUA’s) vision was as follows: \textit{The CUA exists to promote the highest standard of urologic care for Canadians and to advance the science of urology.}\textsuperscript{5} Some other examples of mission and vision statements of well-known medical organizations are shown in Table 2.\textsuperscript{6–9} An organization’s value proposition is a crucial component of its strategy because it is one of the key elements of the strategic triangle.\textsuperscript{10} In simple terms, a value proposition refers to what the organization does — the value it provides — and why it will be successful in providing that value. It may be that as part of the strategic planning process, the value proposition needs to be modified.

PEST and SWOT analyses

During the strategic planning process, identification of the key internal (micro-environment level) forces and major external (macro-environment level) forces affecting the organization is done through SWOT (strengths, weaknesses, opportunities, threats)\textsuperscript{11} and PEST (political, economic, social, and technological factors or trends)\textsuperscript{12} analyses, respectively. These micro-environment and macro-environment level forces can create threats and opportunities for an organization that may have an impact on its activities, performance, and sustainability.

The goals of a SWOT analysis are to assess the micro-environment forces acting upon an organization, including its strengths, weaknesses, market opportunities, and potential threats. A SWOT analysis helps the organization identify significant factors that may impact its success. An example of what a SWOT analysis could look like for a typical urology department or division is shown in Fig. 2.

The goals of a PEST analysis are to identify and address any current or future important external forces, factors, trends, opportunities, and threats that are outside the control of the organization, but may significantly impact an organization. A sample PEST analysis for a typical urology department or division is shown in Fig. 3. SWOT and PEST analyses can be readily performed for almost any type of urological group practice in a small town community setting, large city non-academic setting, or academic environment. The ultimate goal of these two analyses is to identify the critical “make-or-break” issues and opportunities.

\end{figure}
for the organization, solutions to which will inform any changes required to the mission, vision, value proposition, and core values of the organization. These solutions are then expressed as strategic priorities in any strategic plan.

Assimilation of the strategic plan

After the environmental scan is complete, the organization starts pulling the strategic plan together. This process includes risk analysis and development of concrete strategic priorities or objectives. An example of a set of strategic priorities for a typical urology department or division is shown in Fig. 4. There are usually a small manageable number of strategic priorities (i.e., 3–6 strategic priorities for most organizations), and each strategic priority usually has a small number of goals (i.e., 1–6 goals for each strategic priority) to be achieved through action plans. For example, the CUA communicated the following four strategic priorities in its five-year 2014–2019 strategic plan:13

- Increase member engagement
- Be the voice of urology in public and health policy
- Become the pre-eminent urological resource for patients and health professionals
- Ensure the financial stability of the CUA

In this example, each of the CUA’s four strategic priorities would have accompanying action plans designed with appropriate timelines to meet each of the strategic priority’s objectives, and one or two individuals (in this example, likely members of the CUA executive) would be nominated as the most responsible person(s) to be accountable for the successful completion of each action plan.

The balanced scorecard

Kaplan and Norton published the initial concept of the balanced scorecard in their landmark article published in the Harvard Business Review14 and later popularized the concept in a followup article entitled, “Using the balanced scorecard as a strategic management system.”15 The purpose of the balanced scorecard is to focus the organization on key performance metrics that will facilitate successful implementation of its strategic plan. The four interrelated elements of the balanced scorecard are: 1) the internal business processes; 2) the customer; 3) the financials; and 4) learning and growth. These four elements are shown in a sample format of a balanced scorecard, as published by Kaplan and Norton, in Fig. 5.16 The balanced scorecard provides a process by which an organization could avoid focusing solely on the short-term financial metrics. Winning organizations were usually successful in tightly linking their strategic priorities and action plans with the four elements of the balanced scorecard, which in turn allows the organizations to monitor whether or not the strategic plan

is achieving its intended outcomes. Fig. 6 illustrates an example of a balanced scorecard for a potential urology department or division. In this balanced scorecard example, three indicators for each element are shown, and indicators would be connected to the organization’s strategy map, as shown in Fig. 7, for an operational efficiency that results in decreased costs to the healthcare system.

**Personal strategic planning**

In general, strategic plans are most commonly used for an organization’s corporate strategy. But urologists may consider employing a strategic plan for an individual strategic initiative or for their own career strategy. Personal strategic planning for professionals can be a productive exercise to grow personally and professionally.17,18

**Conclusion**

During their careers, many urologists will find themselves in leadership positions, where they are called upon to develop a strategy or become involved in creating a strategic plan. Some urologists may even be required to lead a strategic planning process. This skill set is not familiar to all urologists because many receive little to no formal education or training on strategy and strategic planning. In addition to formal education or training, there are several decent books on strategy that may of interest to urologists, and some are listed in Table 3. Through the application of a simple approach to strategy and developing a strategic plan, urologists may turn a challenging situation into a rewarding one as their organization evolves.

**Competing interests:** Dr. Beiko has received honoraria from Cook Medical. Dr. Davies has been an advisor for Allergan, Boston Scientific, and Pfizer; and has received grants/honoraria from Allergan, Astellas, Boston Scientific, and Pfizer. Dr. Oake has been an advisor for Boston Scientific. The remaining authors report no competing personal or financial interests.

This paper has been peer-reviewed.
